

Zing Performance for Struggling Children

Heidi Anderson Zing Performance Specialist

You know how your child comes home from school feeling sad or upset because they stumbled repeatedly while publicly reading in front of the class that day, or because they determined that they would try hard and

focus and do well on a task, and instead felt like a failure, when they had nothing to turn in when the deadline arrived. Or has your child found themselves in the principal's office or tends to get into trouble at school and is struggling with feeling of low self worth?

We help these types of daily struggles by exercising your child's brain and building skills. Just like a muscle can be strengthened, and indeed changed with exercise, your brain too, specifically the Cerebellum can be changed with targeted balance and coordination exercises that according to Ned Hallowell of the Hallowell Centers, “unlocks potential, improves performance and creates lasting change.”

I am the mom of an ADHD son. My son has had many struggles with focus, concentration, and impulsiveness. I estimate that we have spent upwards of \$20,000 on medications and replacing broken and damaged items over the last 15 years including 2 cars.

Zing has helped more than 50,000 individuals with optimizing the cerebellum. Balance and coordination stimulates the cerebellum causing fine tuning of automatic skills. Smooth reading is one of these automatic skills, focus, concentration and memory along with social/emotional skills are improved and within months you could see fundamental skill improvement.
